SAS at Nordic Congress in Clinical Biochemistry 2016

Come listen to our presentation: Data-driven healthcare.

Data can deliver better clinical performance

SAS Institute helps hospitals in the Nordic countries deliver better quality and patient safety

Data provides insights. Insights bring about change

A complete view of patient care and readmission patterns. Access to all relevant clinical and nonclinical data for real-time decisions. And a better understanding of your clinical performance. We help you improve patient outcomes with analytics software and big data solutions for the health care industry that address your biggest priorities, including:

Health outcomes. Analyze huge volumes of structured and unstructured clinical and operational data to uncover hidden insights on indications, patient/provider concerns and other issues that can affect patient care. Then turn that insight into evidence-based knowledge that can help you predict and improve outcomes.

Patient safety. Identify potential issues before they become a reality by analyzing diverse data sources to predict and medically investigate patient safety signals.

Hospital acquired infections. Together with SAS Institute, Lillebælt Hospital in Denmark has developed a new monitoring system that shows hospital-acquired infections and enable the hospital to quantify how many patients catch an infection while being hospitalized.
